

EDD-637

(standard)

*Louver dimensions furnished approximately 1/2" (13) undersize.

The EDD-637 dual-drainable blade louver is designed to prevent water penetration in non-wind-driven rain applications by collecting water in frame and blade gutters and channeling it into downspouts and away from airflow paths. The EDD-637 is available in a wide array of anodized and painted finishes including custom color matching.

Standard Construction

Material: Mill finish 6063-T5 extruded aluminum

Frame: 6" deep × 0.081" thick (152 × 2) channel

Blades: 37-1/2° × 0.081" (2) thick dual-drainable style

Screen: 1/2" × 0.063" (12.7 × 1.6) expanded and flattened aluminum

Mullion: Visible

Minimum Size: 4.5" × 8" (114 × 203)

Maximum Size:

Single section: 60" × 120" (1524 × 3048)
120" × 60" (3048 × 1524)

Multiple section: Unlimited

Ratings

Free Area: [48" × 48" (1219 × 1219) unit]: 9.2 ft² (0.85 m²)
57.7%

Performance @ Beginning Point of Water Penetration

Free Area Velocity: 1,113 fpm (5.65 m/s)

Air Volume Delivered: 10,242 cfm (4.83 m³/s)

Pressure Loss: 0.15 in.wg. (37 Pa)

Velocity @ 0.15 in.wg. Pressure Loss: 1,106 fpm (5.62 m/s)

Std. Design Load: 25 psf

Options

■ Factory finish:

- High Performance Fluoropolymer
- Baked Enamel ■ Prime Coat
- Clear Anodize ■ Integral Color Anodize

■ Frame options:

- 1-1/2" (38) flange frame ■ Custom size flange
- Stucco flange ■ Glazing frame

■ Installation hardware

- Clip angles ■ Continuous angles

■ Hidden vertical mullion

■ Alternate bird or insect screens

■ Insulated or non-insulated blank-off panels

■ Filter racks

■ Hinged frame

■ Subframe

■ Head and/or sill flashing

■ Burglar bars

■ Frame closure

■ Net OD (actual size)

NOTE: Dimensions in parentheses () are millimeters.

Water Penetration

AMCA defines the beginning point of water penetration as the free area velocity at the intersection of a simple linear regression of test data and the line of 0.01 ounces of water per square foot of free area measured through a 48" x 48" louver during a 15 minute period. The AMCA water penetration test provides a method for comparing louver models and designs as to their efficiency in resisting the penetration of rainfall under specific lab conditions. We recommend that intake louvers are selected with a reasonable margin of safety below the beginning point of water penetration in order to avoid unwanted penetration during severe storm conditions.

Beginning Point of Water Penetration = 1,113 fpm

Pressure Loss

(Data corrected to standard air density.)

Louver Test Size = 48" x 48" (1219 x 1219)
Pressure loss tested in accordance with
Figure 5.5 of AMCA Standard 500-L.
